Abstract of JP 2002366519 (A)

PROBLEM TO BE SOLVED: To provide an electronic authentication system and an electronic authentication method by which costs for introduction and maintenance are lowered and which is easily managed. **SOLUTION:** A server 20 for generating password generates passwords by every one of a plurality of user terminals 30 and simultaneously transmits the generated passwords to the plurality of user terminals 30. In addition, the server 20 for generating password transmits the generated password and an identifier to specify the user terminal 30 to a server 40 for certification. The user terminal 30 transmits the password transmitted from the server 20 for generating password and the identifier of the user terminal 30 to the server 40 for authentication to obtain the authentication. The server 40 for authentication collates the password transmitted from the user terminal 30 and the identifier of the user terminal 30 with the password and the identifier stored in a password information storage part and authenticates the user terminal 30.
